Alright, so next, we're going to take a look at what you've done so far so we are going to go ahead and select the whole thing so we just open up with the selection tool and you want to make sure you are selecting everything, not just the source files and not just the package, the whole thing so we go over here to the top of the timeline and we click on that and then we go ahead and select everything and then we click this little arrow right here to get rid of everything on the timeline. And then we're going to go to layers and layer and it's just about all of the layers and we click on that little "Package" button and then we are going to save that package. It's gonna save it to your working directory and it's gonna save it to your package. You can call it whatever you want. So, right now, it's gonna look like this. So the first thing we're going to do is we're gonna go back into our package and we are going to select the source file so we're gonna click on that and then we're gonna go ahead and hit Shift + S. And what that's gonna do is it's gonna save that file. It's gonna give you the location and it's gonna give you a package identifier and it's gonna save that to your working directory so it's going to make a package with that identifier. You can name it anything you want and if you don't know, you want to just name it what you feel like. So in this case, if you wanted to name it whatever you are naming 1d6a3396d6

i am a pc user and on january 4th i uninstalled windows 7 ultimate and installed ubuntu 13.10.i want to have the same experience of windows and i think linux is the only os that can satisfy my demand,i downloaded the ubuntu software centre and it has a lot of software which i dont want,there is a software in the software centre which is a boot loader installer and it has a confirmation message in the title which says "Install a boot loader on an EFI-based computer" i just want to know what is an EFI-based computer and why do i need to install a boot loader.i would be glad if someone could answer my question. If the computer has UEFI firmware, then you have an EFI-based computer, you do not need to install a boot loader. If you have BIOS, then you do not need to install a boot loader. The program is a fairly nice one, even if it lacks in a few features and thus is not as good as most other programs out there. However, it is still a good alternative to many other programs which are in use.
